

PHP | DAY 6 | CLASSWORK

Exercise 1

Create a basic web application that includes a user registration system.

Your task is to:

- **Build a registration form** where users can sign up by providing their information like, first name, last name, age, email address, password, and an image (feel free to expand it). Make sure you validate the inputs to check for empty fields, remove unnecessary spaces, and protect against harmful scripts.

Implement functionality so that when a user clicks the signup button, their information is saved to a 'users' table in your database, creating a new record.

Don't forget to create the database first with the necessary columns.
