

ANGULAR | DAY 1 | CLASSWORK

Exercise 1

Create an Angular Single-Page-Application with two pages, Home Page and About us Page. The theme of the App should be a Tourist Agency (design example below).

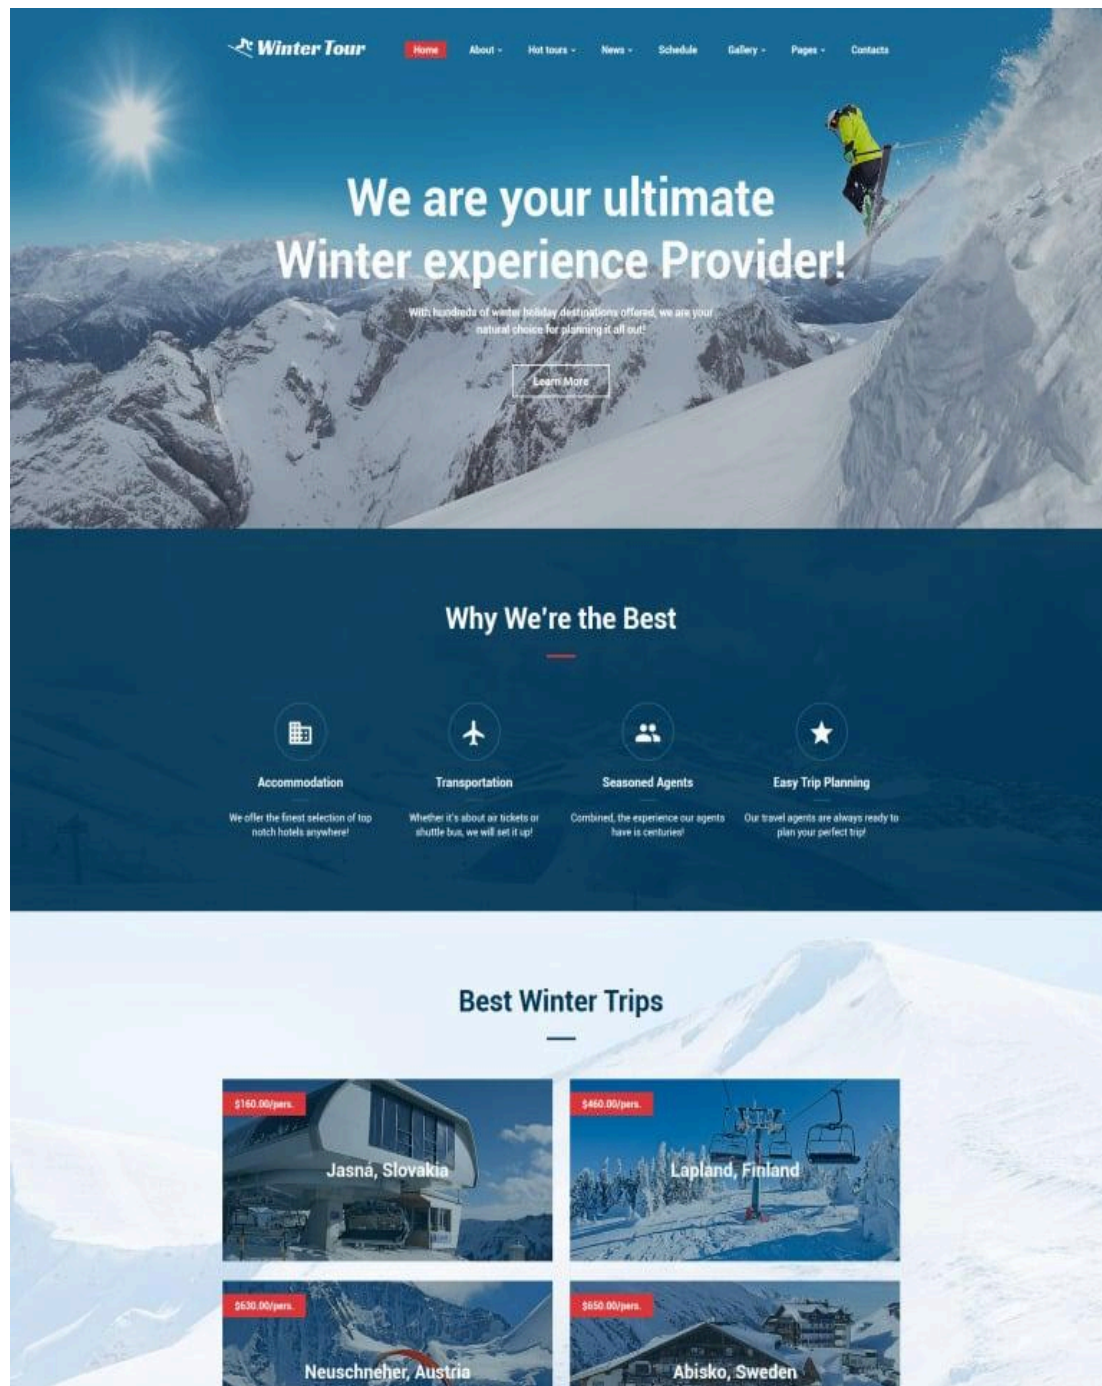

The Home page should have a hero section with a Heading and short text. Additionally a button with a text of "Learn more". Under the Hero section in three columns and two rows display 6 different tourist destination with their names, price, number of nights and city.

When the user clicks on "Learn more" button redirect him to About us page, where you should display a few info about the company.

Make sure to implement the following Angular Concepts:

- Two Pages (components which will nest another components) Home page and About us Page
- The Navbar should be a separate component
- The Hero section should be a separate component
- Implement routing for navigating between the pages
- Use interpolation for displaying data into the Template
- Use the Bootstrap library for styling the App

Please note: The whole workflow for building such an App is covered in the Day 1 pre-work of the Angular course.
