PHP | DAY 4 | CLASSWORK

Exercise 1

Yesterday, we set up our Restaurant Database and made it possible to display all meals and their details. Today, you're going to add new features that let you add new meals, including images (file upload), to your database. This is your chance to put into practice what you've learned about handling forms and file uploads in PHP.

What You Will Do:

- Insert a new meal: You'll make a page with a form where you can enter details for a new meal including a name, price, description, and an option to upload an image.
- File Upload: Create a new file "file_upload.php" for the image upload logic. Make sure that your images are being saved locally and in the database
- Update the image paths: Modify the paths for images on both index.php and details.php page to reflect the new storage location.
